GROUP BY

GROUP BY statement is used to group the result-set by one or more columns.

```
SELECT column(s) FROM tablename
WHERE condition
GROUP BY column(s)
ORDER BY column(s);
```

The GROUP BY statement is usually used with aggregate functions (count, max, min, sum, avg) to group the resultset by one or more columns.

Employee (id, name, department, salary, city)

Number of employees from each city in the order from most number of employees to least number of employees in the city.

```
select count(id), city
From Employee
Group by city
Order by count(id) DESC;
```
